Probabilistic Models

- Models describe how (a portion of) the world works
- Models are always simplifications
 - May not account for every variable
 - May not account for all interactions between variables
 - “All models are wrong; but some are useful.”
 - George E. P. Box
- What do we do with probabilistic models?
 - We (or our agents) need to reason about unknown variables, given evidence
 - Example: explanation (diagnostic reasoning)
 - Example: prediction (causal reasoning)

Assignment Project Exam Help

Add WeChat powcoder

Probability Recap

- Conditional probability $P(x|y) = \frac{P(x, y)}{P(y)}$

- Product rule $P(x, y) = P(x|y)P(y)$

- Chain rule
$$P(X_1, X_2, \dots, X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2) \dots$$
$$= \prod_{i=1}^n P(X_i|X_1, \dots, X_{i-1})$$

Independence

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Independence

- Two variables are *independent* if:

$$\forall x, y : P(x, y) = P(x)P(y)$$

Assignment Project Exam Help

- This says that their joint distribution *factors* into a product two simpler distributions

<https://powcoder.com>

- Another form: $\forall x, y : P(x|y) = P(x)$

Add WeChat powcoder

- We write: $X \perp\!\!\!\perp Y$

- Independence is a simplifying *modeling assumption*

- What could we assume for {Weather, Traffic, Cavity, Toothache}?

Example: Independence?

Assignment Project Exam Help

Example: Independence

- N fair, independent coin flips:

$$P(X_1)$$

H	0.5
T	0.5

$$P(X_2)$$

H	0.5
T	0.5

$$P(X_n)$$

H	0.5
T	0.5

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Conditional Independence

- Unconditional (absolute) independence very rare
- *Conditional independence* is our most basic and robust form of knowledge about uncertain environments.

<https://powcoder.com>

- X is conditionally independent of Y given Z

$X \perp\!\!\!\perp Y | Z$

if and only if:

$$\forall x, y, z : P(x, y | z) = P(x | z)P(y | z)$$

or, equivalently, if and only if

$$\forall x, y, z : P(x | z, y) = P(x | z)$$

Conditional Independence

- $P(\text{Toothache}, \text{Cavity}, \text{Catch})$
- If I have a cavity, the probability that the probe catches in it doesn't depend on whether I have a toothache:
 - $P(+\text{catch} \mid +\text{toothache}, +\text{cavity}) = P(+\text{catch} \mid +\text{cavity})$
- The same independence holds if I don't have a cavity:
 - $P(+\text{catch} \mid +\text{toothache}, -\text{cavity}) = P(+\text{catch} \mid -\text{cavity})$
- Catch is *conditionally independent* of Toothache given Cavity:
 - $P(\text{Catch} \mid \text{Toothache}, \text{Cavity}) = P(\text{Catch} \mid \text{Cavity})$
- **Equivalent statements:**
 - $P(\text{Toothache} \mid \text{Catch}, \text{Cavity}) = P(\text{Toothache} \mid \text{Cavity})$
 - $P(\text{Toothache}, \text{Catch} \mid \text{Cavity}) = P(\text{Toothache} \mid \text{Cavity}) P(\text{Catch} \mid \text{Cavity})$
 - One can be derived from the other easily

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Conditional Independence

- What about this domain:
 - Traffic
 - Umbrella
 - Raining

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Conditional Independence

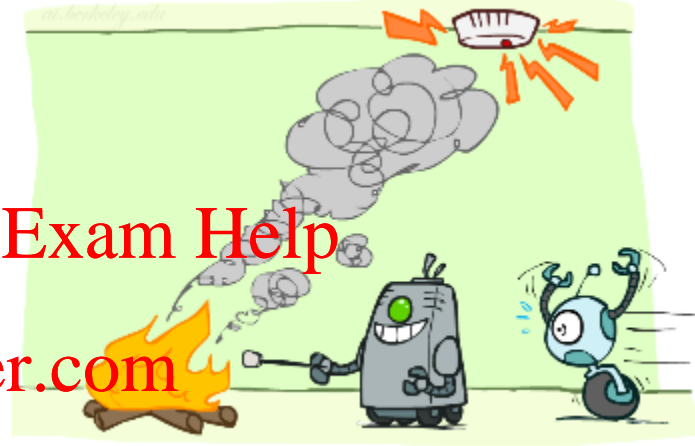

- What about this domain:

- Fire
- Smoke
- Alarm

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Conditional Independence and the Chain Rule

- Chain rule: $P(X_1, X_2, \dots, X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2) \dots$

- Trivial decomposition: **Assignment Project Exam Help**

$$P(\text{Traffic}, \text{Rain}, \text{Umbrella}) = P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain}, \text{Traffic})$$

<https://powcoder.com>
Add WeChat powcoder

- With assumption of conditional independence:

$$P(\text{Traffic}, \text{Rain}, \text{Umbrella}) = P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain})$$

- Bayes'nets / graphical models help us express conditional independence assumptions

Ghostbusters Chain Rule

- Each sensor depends only on where the ghost is

$$P(T,B,G) = P(G) P(T|G) P(B|G)$$

- That means, the two sensors are conditionally independent, given the ghost position

- T: Top square is red
- B: Bottom square is red
- G: Ghost is in the top

- Givens:

$$P(+g) = 0.5$$

$$P(-g) = 0.5$$

$$P(+t | +g) = 0.8$$

$$P(+t | -g) = 0.4$$

$$P(+b | +g) = 0.4$$

$$P(+b | -g) = 0.8$$

T	B	G	P(T,B,G)
+t	+b	+g	0.16
+t	+b	-g	0.16
+t	-b	+g	0.24
+t	-b	-g	0.04
-t	+b	+g	0.04
-t	+b	-g	0.24
-t	-b	+g	0.06
-t	-b	-g	0.06

Bayes' Nets: Big Picture

Bayes' Nets: Big Picture

- Two problems with using full joint distribution tables as our probabilistic models:
 - Unless there are only a few variables, the joint is WAY too big to represent explicitly
 - Hard to learn (estimate) anything empirically about more than a few variables at a time

Assignment Project Exam Help

<https://powcoder.com>

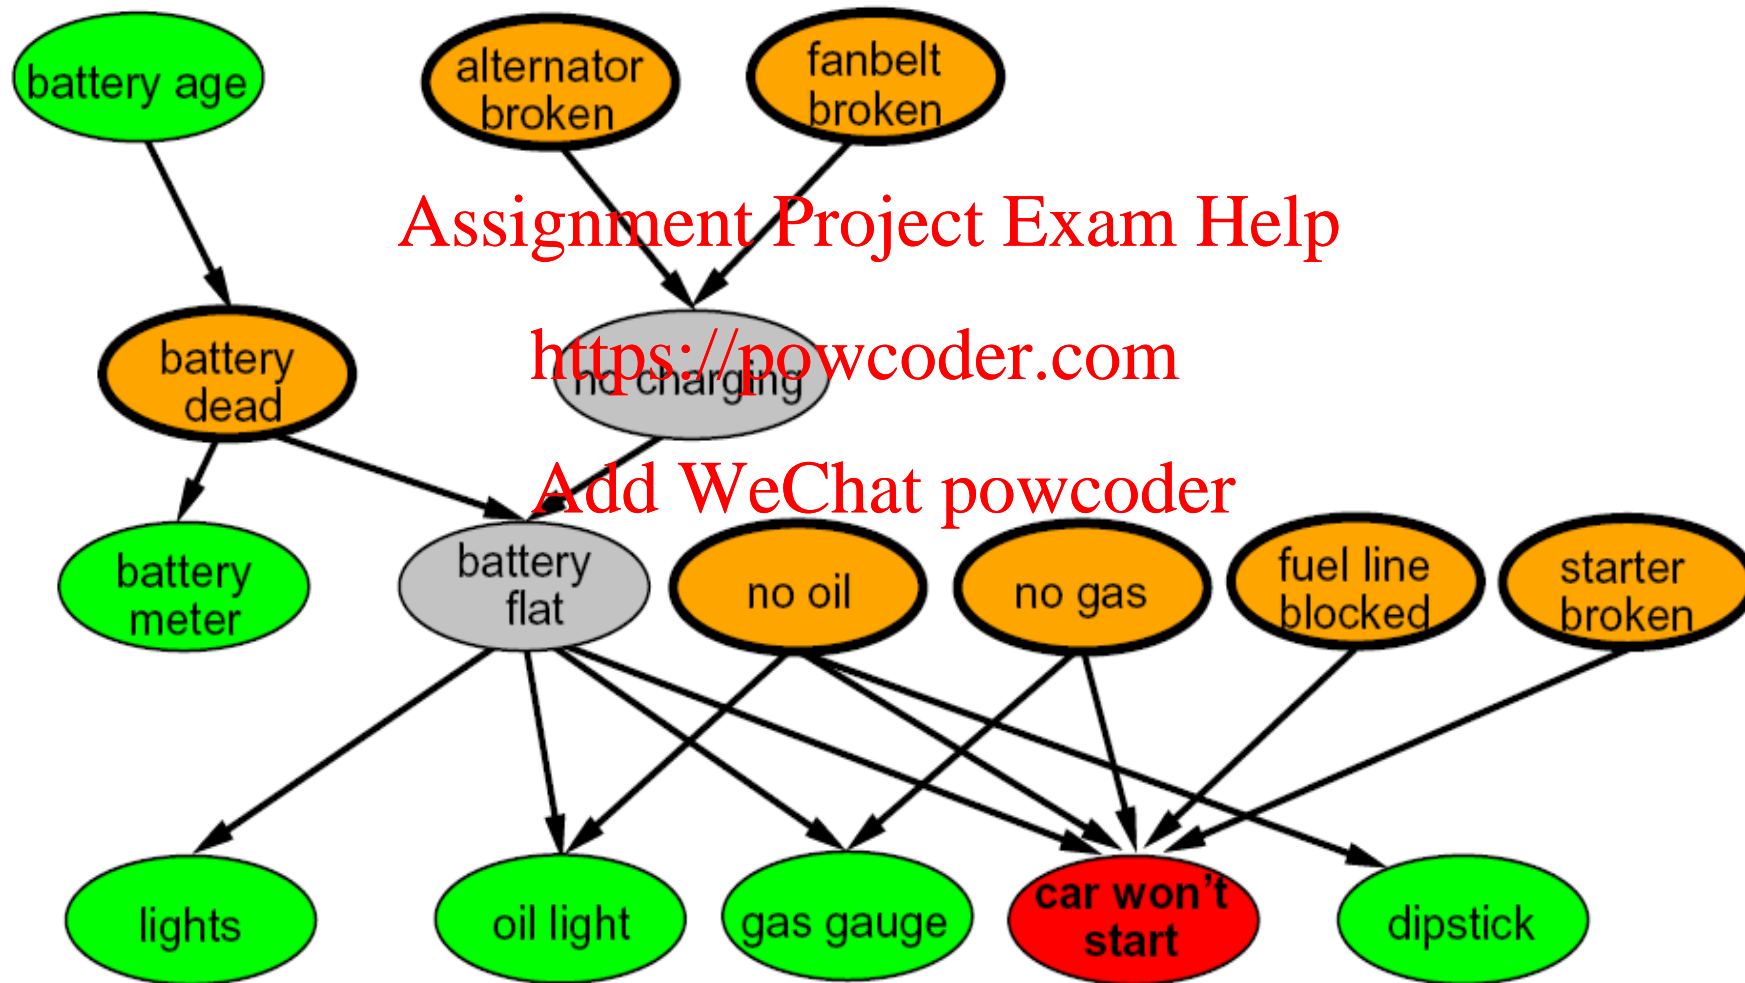

- Bayes' nets:** a technique for describing complex joint distributions (models) using simple, local distributions (conditional probabilities)
 - More properly called **graphical models**
 - We describe how variables locally interact
 - Local interactions chain together to give global, indirect interactions
 - For about 10 min, we'll be vague about how these interactions are specified

Example Bayes' Net: Insurance

Example Bayes' Net: Car

Graphical Model Notation

- Nodes: variables (with domains)
 - Can be assigned (observed) or unassigned (unobserved)
- Arcs: interactions
 - Similar to CSP constraints
 - Indicate “direct influence” between variables
 - Formally: encode conditional independence (more later)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- For now: imagine that arrows mean direct causation (in general, they don't!)

Example: Coin Flips

- N independent coin flips

X_1

X_2

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

X_n

- No interactions between variables: **absolute independence**

Example: Traffic

- Variables:
 - R: It rains
 - T: There is traffic
- Model 1: independence

- Why is an agent using model 2 better?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Model 2: rain causes traffic

Example: Traffic II

- Let's build a causal graphical model!

- Variables

- T: Traffic
- R: It rains
- L: Low pressure
- D: Roof drips
- B: Ballgame
- C: Cavity

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Example: Alarm Network

- Variables
 - B: Burglary
 - A: Alarm goes off
 - M: Mary calls
 - J: John calls
 - E: Earthquake!

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Bayes' Net Semantics

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Bayes' Net Semantics

- A set of nodes, one per variable X
- A directed, acyclic graph
- A conditional distribution for each node
 - A collection of distributions over X , one for each combination of parents' values
- CPT: conditional probability table
- Description of a noisy “causal” process

$$P(X|a_1 \dots a_n)$$

$$P(X|A_1 \dots A_n)$$

A Bayes net = Topology (graph) + Local Conditional Probabilities

Probabilities in BNs

- Bayes' nets **implicitly** encode joint distributions

- As a product of local conditional distributions

- To see what probability a BN gives to a full assignment, multiply all the relevant conditionals together:

$$P(x_1, x_2, \dots, x_n) = \prod_{i=1}^n P(x_i | \text{parents}(X_i))$$

Add WeChat powcoder

- Example:

$$P(+cavity, +catch, -toothache)$$

Probabilities in BNs

- Why are we guaranteed that setting

$$P(x_1, x_2, \dots, x_n) = \prod_{i=1}^n P(x_i | \text{parents}(X_i))$$

results in a proper joint distribution?

Assignment Project Exam Help

- Chain rule (valid for all distributions): $P(x_1, x_2, \dots, x_n) = \prod_{i=1}^n P(x_i | x_1 \dots x_{i-1})$
- Assume conditional independences: $P(x_i | x_1, \dots, x_{i-1}) = P(x_i | \text{parents}(X_i))$

Add WeChat powcoder

→ Consequence:
$$P(x_1, x_2, \dots, x_n) = \prod_{i=1}^n P(x_i | \text{parents}(X_i))$$

- Not every BN can represent every joint distribution
 - The topology enforces certain conditional independencies

Example: Coin Flips

$P(X_1)$

h	0.5
t	0.5

$P(X_2)$

h	0.5
t	0.5

...

$P(X_n)$

h	0.5
t	0.5

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

$$P(h, h, t, h) =$$

Only distributions whose variables are absolutely independent can be represented by a Bayes' net with no arcs.

Example: Traffic

$$P(R)$$

+r	1/4
-r	3/4

$$P(T|R)$$

+r	<table><tr><td>+t</td><td>3/4</td></tr><tr><td>-t</td><td>1/4</td></tr></table>	+t	3/4	-t	1/4
+t	3/4				
-t	1/4				
-r	<table><tr><td>+t</td><td>1/2</td></tr><tr><td>-t</td><td>1/2</td></tr></table>	+t	1/2	-t	1/2
+t	1/2				
-t	1/2				

$$P(+r, -t) =$$

-r	-t	6/16

Size of a Bayes' Net

- How big is a joint distribution over N Boolean variables?

$$2^N$$

- Both give you the power to calculate

$$P(X_1, X_2, \dots, X_n)$$

Assignment Project Exam Help
Big space savings!

- How big is an N-node net if nodes have up to k parents?

$$O(N * 2^{k+1})$$

Also easier to elicit local CPTs
<https://powcoder.com>

Add WeChat Also faster to answer queries (coming)
powcoder

Causality?

- When Bayes' nets reflect the true causal patterns:

- Often simpler (nodes have fewer parents)
- Often easier to think about
- Often easier to elicit from experts

Assignment Project Exam Help

- BNs need not actually be causal <https://powcoder.com>

- Sometimes no causal net exists over the domain (especially if variables are missing)
- E.g. consider the variables *Traffic* and *Drips*
- End up with arrows that reflect correlation, not causation

Add WeChat powcoder

- What do the arrows really mean?

- Topology may happen to encode causal structure
- **Topology really encodes conditional independence**

$$P(x_i | x_1, \dots, x_{i-1}) = P(x_i | \text{parents}(X_i))$$

Bayes' Nets

- So far: how a Bayes' net encodes a joint distribution
- Next: how to answer queries about that distribution
 - Today:
 - First assembled BNs using an intuitive notion of conditional independence as causality
 - Then saw that key property is conditional independence
 - Main goal: answer queries about conditional independence and influence
- After that: how to answer numerical queries (inference)
